

NORTHWIND ENERGY - ANNUAL BOARD REVIEW

Northwind Energy closed the financial year with revenue below the guidance issued at the start of the period. The shortfall was concentrated in the third quarter and was attributed to delayed grid connection approvals rather than to any loss of customers to competitors.

Maya Ellison, an engineer at Northwind Energy, led the preparation of the remediation plan and presented it to the board in November. Her assessment was that the delays were procedural rather than technical.

Tomas Reyes, the chief financial officer of Northwind Energy, supported the plan and took responsibility for the reporting changes it requires. He noted that the company had no single view of connection milestones before this year.

Kestrel Grid remains the largest counterparty of Northwind Energy by contract value. The transmission agreement between the two firms was renewed during the year for a further two years on substantially the same commercial terms.

The board recorded a concentration risk: Kestrel Grid represents a large enough share of revenue that the loss or renegotiation of the transmission agreement would be significant. No action was proposed this year.
